	<u> </u>			
	1 Number Representation			
1.1	What is the range of integers represented by a $n$ -bit binary number? Your answers should include expressions that use $2^n$ .			
	(a) Unsigned:			
	(b) Two's Complement:			
	(c) Bias (with bias $b$ ):			
1.2	How many unique integers can be represented in each case?  (a) Unsigned:			
	(b) Two's Complement:			
	(c) Bias (with bias $b$ ):			

## 2 Memory Addresses

2.1 Consider the following C program:

```
int a = 5;
int main()
{
    int b = 0;
    char* s1 = "cs61c";
    char s2[] = "cs61c";
    char* c = malloc(sizeof(char) * 100);
    return 0;
};
```

For each of the following values, state the location in the memory layout where they are stored. Answer with code, static, heap, or stack.

- (a) s1
- (b) s2
- (c) s1[0]
- (d) s2[0]
- (e) c[0]
- (f) a

2.2 Consider the C code here, and assume the malloc call succeeds. Rank the value of each variable (which may be an address!) from 1 to 5 (with 1 being the least) right before bar returns. Use the memory layout from class; Treat all addresses as unsigned numbers.

```
#include <stdlib.h>
int FIVE = 5;
int bar(int x) {
    return x * x;
}
int main(int argc, char *argv[]) {
    int *foo = malloc(sizeof(int));
    if (foo) free(foo);
    bar(10); // snapshot just before it returns
    return 0;
}
foo:
&foo:
FIVE: _____
&FIVE: _____
&x:
```

## 3 Linked Lists Revisited

3.1 Fill out the declaration of a singly linked linked-list node below.

```
typedef struct node {
    int value;
    _____ next; // pointer to the next element
} sll_node;
```

3.2 Let's convert the linked list to an array. Fill in the missing code.

```
int* to_array(sll_node *sll, int size) {
    int i = 0;
    int *arr = _____;
    while (sll) {
        arr[i] = _____;
        sll = _____;
        -____;
    }
    return arr;
}
```

3.3 Finally, complete the function delete\_even() that will delete every second element of the list. For example, given the lists below:

```
Before: Node 1 \rightarrow Node 2 \rightarrow Node 3 \rightarrow Node 4
After: Node 1 \rightarrow Node 3
```

Calling delete\_even() on the list labeled "Before" will change it into the list labeled "After". All list nodes were created via dynamic memory allocation.

```
void delete_even(sll_node *s11) {
    sll_node *temp;
    if (!sll || !sll->next) {
        return;
    }
    temp = ____;
    sll->next = ____;
    free(_____);
    delete_even(_____);
}
```

## Floating Point Intro

The IEEE standard defines a binary representation for floating point using  $\mathbf{sign},\,\mathbf{significant},\,\mathbf{and}\,\,\mathbf{mantissa}.$ 

Sign	Exponent	Significand
1 bit	8 bits	23 bits

For normalized floats:

Value =  $(-1)^{Sign}$  x  $2^{(Exponent - Bias)}$  x 1.significand<sub>2</sub>

For denormalized floats: Value =  $(-1)^{Sign} \times 2^{(Exponent - Bias + 1)} \times 0.significand_2$ 

Exponent	Significand	Meaning
0	Anything	Denorm
1-254	Anything	Normal
255	0	Infinity
255	Nonzero	NaN

- (a) How would 10.625 be represented in floating point format? 4.1
  - (b) What decimal number is encoded as 0xC0A80000?
  - (c) How many non-negative floats are strictly less than 2?
  - (d) What is the smallest positive value that can be stored using a single precision float?

## 5 More Floating Point (Sp18 Final)

- 5.1 IEEE 754-2008 introduces half precision, which is a binary floating-point representation that uses 16 bits: 1 sign bit, 5 exponent bits (with a bias of 15) and 11 significand bits. This format uses the same rules for special numbers that IEEE754 uses. Considering this half-precision floating point format, answer the following questions:
  - (a) For 16-bit half-precision floating point, how many different valid representations are there for NaN?
  - (b) What is the smallest non-infinite number it can represent? You can leave your answer as an expression.
  - (c) What is the largest non-infinite number it can represent? You can leave your answer as an expression.
  - (d) How many floating point numbers are in the interval [1, 2) (including 1 but excluding 2?
